## Product Description

Hot Rolled SS304 Stainless Steel Plates Sheets 10mm Thickness Customized Annealed

This grade of stainless steel has an austenitic crystal structure and is one of the most widely used grades. 304 is often conflated with 18-8 stainless steel but has slight differences in some of its alloying elements. It has good corrosion resistance characteristics and excellent formability, making it ideal for sheet metal components. Applications can include food processing equipment like tanks and structural bracketing.

This austenitic grade of stainless steel contains molybdenum which further improves its resistance to corrosion. In addition to this, it is highly formable and weldable. Common applications include parts that are exposed to corrosive conditions like chemical tanks or marine equipment.
